

VP Indicator

4th Dimension VP indicator provides a comprehensive analysis of the distribution of volume over a user defined lookback number of days. The output includes:

- Volume Point of Control (POC)
- Upper Value Area (UVA)
- Lower Value Area (LVA)
- Volume Weighted Average Price (VWAP)
- Graphical display of volume distribution

The trader is also able to define the percentage of the distribution that they would like to consider in generating the Upper and Lower Value areas of the distribution (default is 70%).

The POC, UVA, and LVA are likely to act as support and resistance and the higher the lookback the more likely this will be true.

Within the Set-Up parameters the user can modify the number of days to analyse the volume distribution and the Upper/Lower distribution area calculation %.
